Colorectal Cancer
Getting Checked for Colon Cancer: Which Test Should I Get?
Reviewed February 2018

Why should I be tested for colon cancer?

Screening could save your life!

Colon cancer is the second most common cause of cancer death in men and women combined in Kentucky.

The good news is that screening tests can find this cancer early, when treatment works best. It is important to get checked regularly.

It’s the Right Choice!

Who should be tested for colon cancer?

In order to know who needs a colon cancer screening, it’s important to know some common risk factors for developing this cancer:

<table>
<thead>
<tr>
<th>People at Average Risk</th>
<th>People at Increased Risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Ages 50-75</td>
<td>• Have a personal history of colon cancer or polyps</td>
</tr>
<tr>
<td>• After 75, discuss with your doctor if</td>
<td>• Have a family history of colon cancer or polyps</td>
</tr>
<tr>
<td>screening needs to be continued</td>
<td>• Some medical organizations recommend African Americans begin screening at age 45</td>
</tr>
<tr>
<td></td>
<td>• Have a history of inflammatory bowel disease (Crohn’s or colitis)</td>
</tr>
</tbody>
</table>

People who are at an increased risk, must get screened more frequently.

Which test should I have?

There’s more than One Test—You have a Choice!

There is more than one test recommended for colon cancer screening- it’s important to talk to your doctor about your risk factors to find the right test for you. Some tests include fecal or stool blood testing (FIT or gFOBT) or looking at the colon and rectum (colonoscopy or sigmoidoscopy). You can read about some of these tests on the back page.
<table>
<thead>
<tr>
<th>How often do I get screened?</th>
<th>Test Name</th>
<th>What happens?</th>
</tr>
</thead>
</table>
| Once a Year                 | FIT (Fecal Immuno-chemical Test)* | • Looks for blood in the stool  
• No known preparation or dietary restrictions  
• No risk involved  
• Inexpensive and usually covered by insurance |
| Low Risk Test               | gFOBT (Guaiac Fecal Occult Blood Test)* | • Looks for blood in the stool  
• Doctor may ask you to avoid certain foods and medicines  
• No risk involved  
• Inexpensive and usually covered by insurance |
| Every 10 Years              | Colonoscopy | • Doctor finds and removes any pre-cancerous growths (called polyps) in the colon using a lighted tube (called a colonoscope)  
• Preparation is needed- bowel must be completely emptied  
• There is a small risk from the procedure or medication  
• Expensive and usually covered by insurance with copays or deductibles. Some insurance companies will charge more if your doctor finds and removes a growth or polyp. |
| Test may have risks         |           |               |

*People at high risk must get screened more regularly and may have to be screened with a colonoscopy.*
